

Disjoint Sets

COMP 2210 – Dr. Hendrix

SAMUEL GINN
COLLEGE OF ENGINEERING

Applications – equivalence classes, connectedness

Kruskall's algorithm

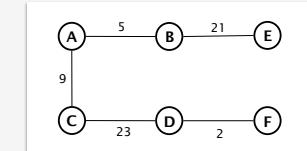

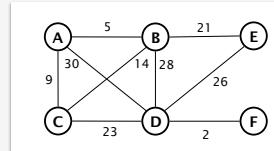

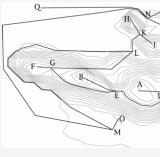

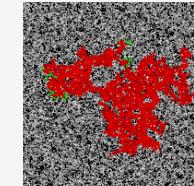

Image processing

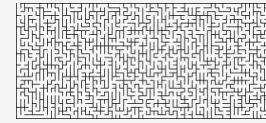

Percolation system modeling

water, oil, etc. through ground
disease through populations

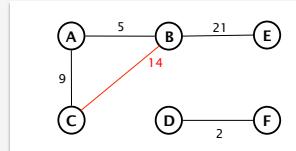

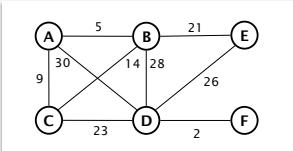

Maze layout, generation

COMP 2210 • Dr. Hendrix • 2

Context – Kruskall's MST algorithm

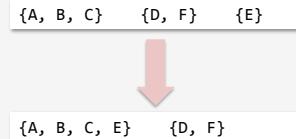

```
Initialize MST with all vertices but no edges
Add all the edges to a collection E
while (still more edges in E) && (have not added n-1 edges to the MST) {
    Remove the edge with minimum cost from E.
    Add it to the MST if it does not create a cycle.
}
```

Maintain a set of the connected components in the MST.

```
if (find(u) != find(v)) {
    // add edge (u,v) to MST
    union(u, v);
}
```

```
if (!connected(u, v)) {
    // add edge (u,v) to MST
    union(u, v);
}
```

{A, B, C} {D, F} {E}

{A, B, C, E} {D, F}

COMP 2210 • Dr. Hendrix • 3

Disjoint Set

A **disjoint set** is a collection that contains a set of elements that are partitioned into disjoint (non-overlapping) subsets.

```
public interface DisjointSet {
    /**
     * combine components containing p and q
     */
    void union(int p, int q);

    /**
     * return component id for p
     */
    int find(int p);

    /**
     * are p and q in the same component?
     */
    boolean connected(int p, int q);

    /**
     * return number of connected components
     */
    int count();
}
```

Typical application problems involve N elements that begin as individual disjoint sets, and the problem solution involves a sequence of union and find operations.

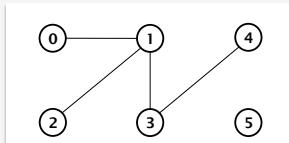

COMP 2210 • Dr. Hendrix • 4

Disjoint Set operations

```

count()          6
connected(3, 5) false
connected(0, 4) false
union(0, 1)
union(3, 4)      {0} {1} {2} {3} {4} {5}
count()          4
connected(0, 4) false
union(1, 3)      {0, 1, 3, 4} {2} {5}
connected(0, 4) true
union(2, 1)
count()          2

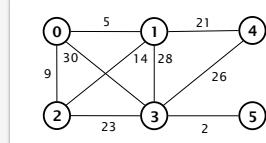

```

COMP 2210 • Dr. Hendrix • 5

Kruskall's MST algorithm with disjoint sets

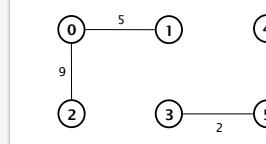

Original graph

Disjoint Set of MST components
{0} {1} {2} {3} {4} {5}

connected(3, 5) false, ok to add
add (3, 5) to MST
union(3, 5)

Minimum Spanning Tree

{0} {1} {2} {3, 5} {4}

connected(0, 1) false, ok to add
add (0, 1) to MST
union(0, 1)

{0, 1} {2} {3, 5} {4}

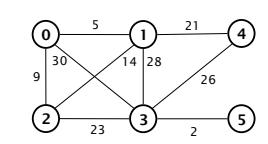

connected(0, 2) false, ok to add
add (0, 2) to MST
union(0, 2)

{0, 1, 2} {3, 5} {4}

COMP 2210 • Dr. Hendrix • 6

Kruskall's MST algorithm with disjoint sets (cont.)

Original graph

Disjoint Set of MST components

{0, 1, 2} {3, 5} {4}

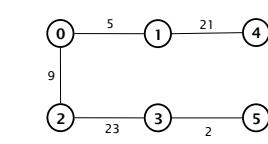

connected(1, 2) true, adding would create cycle

connected(1, 4) false, ok to add

add (1, 4) to MST

union(1, 4)

Minimum Spanning Tree

{0, 1, 2, 4} {3, 5}

connected(2, 3) false, ok to add

add (2, 3) to MST

union(2, 3)

{0, 1, 2, 3, 4, 5}

Disjoint Set

A **disjoint set** is a collection that contains a set of elements that are partitioned into disjoint (non-overlapping) subsets.

```

public interface DisjointSet {
    /**
     * combine components containing p and q
     */
    void union(int p, int q);

    /**
     * return component id for p
     */
    int find(int p);

    /**
     * are p and q in the same component?
     */
    boolean connected(int p, int q);

    /**
     * return number of connected components
     */
    int count();
}

```

Typical application problems involve N elements that begin as individual disjoint sets, and the problem solution involves a sequence of union and find operations.

Implementation strategies must consider the cost of a sequence of operations, not just the individual operations themselves.

COMP 2210 • Dr. Hendrix • 7

COMP 2210 • Dr. Hendrix • 8

Disjoint Set – fast find/connected

Fast find strategy: Let each component be identified by the label of one vertex in that component. Store these “component ids” in an int array such that $\text{id}[i] == \text{component id of element } i$.

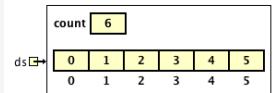

Initially:

| | | | | | |
|-----|-----|-----|-----|-----|-----|
| {0} | {1} | {2} | {3} | {4} | {5} |
| 0 | 1 | 2 | 3 | 4 | 5 |

```
public class FastFindDS implements DisjointSet {
    private int[] id; // component ids
    private int count; // number of components

    public FastFindDS(int N) {
        count = N;
        id = new int[N];
        for (int i = 0; i < N; i++)
            id[i] = i;
    }
}
```

FastFindDS ds;
 $ds = \text{new FastFindDS}(6);$

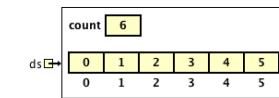

COMP 2210 • Dr. Hendrix • 9

Disjoint Set – fast find/connected

```
public class FastFindDS implements DisjointSet {
    private int[] id; // component ids
    private int count; // number of components
```

```
/** * return component for p */
public int find(int p) {
    return id[p];
}
```

```
/** * are p and q in the same component? */
public boolean connected(int p, int q) {
    return find(p) == find(q);
}

/** * return number of connected components */
public int count() {
    return count;
}
```

COMP 2210 • Dr. Hendrix • 10

Disjoint Set – fast find/connected

Fast find strategy: Let each component be identified by the label of one vertex in that component. Store these “component ids” in an int array such that $\text{id}[i] == \text{component id of element } i$.

| | |
|-------------------------|------------------------|
| {0} {1} {2} {3} {4} {5} | 0 1 2 3 4 5 |
| union(3, 5) | {0} {1} {2} {3, 5} {4} |
| union(0, 2) | {0, 2} {1} {3, 5} {4} |
| union(1, 0) | {0, 1, 2} {3, 5} {4} |

| | |
|-------------|-------------|
| 0 1 2 3 4 5 | 0 1 2 3 4 5 |
| 0 1 2 3 4 5 | 0 1 2 5 4 5 |
| 0 1 2 3 4 5 | 2 1 2 5 4 5 |
| 0 1 2 3 4 5 | 2 2 2 5 4 5 |

COMP 2210 • Dr. Hendrix • 11

Disjoint Set – fast find/connected

Fast find strategy: Let each component be identified by the label of one vertex in that component. Store these “component ids” in an int array such that $\text{id}[i] == \text{component id of element } i$.

| | |
|-------------------------|------------------------|
| {0} {1} {2} {3} {4} {5} | 0 1 2 3 4 5 |
| union(3, 5) | {0} {1} {2} {3, 5} {4} |
| union(0, 2) | {0, 2} {1} {3, 5} {4} |
| union(1, 0) | {0, 1, 2} {3, 5} {4} |

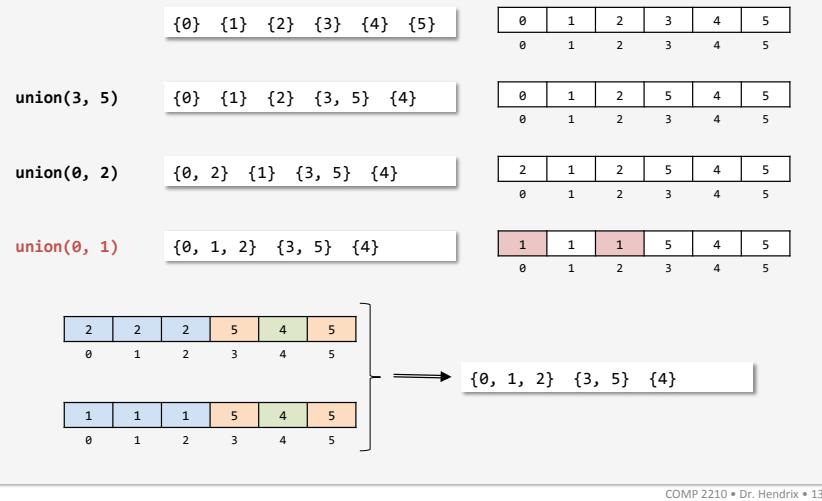

| | |
|-------------|-------------|
| 0 1 2 3 4 5 | 0 1 2 3 4 5 |
| 0 1 2 3 4 5 | 0 1 2 5 4 5 |
| 0 1 2 3 4 5 | 2 1 2 5 4 5 |
| 0 1 2 3 4 5 | 2 2 2 5 4 5 |

Parameter order can't matter, so union isn't as efficient as the last example might have implied.

COMP 2210 • Dr. Hendrix • 12

Disjoint Set – fast find/connected

Fast find strategy: Let each component be identified by the label of one vertex in that component. Store these “component ids” in an int array such that $\text{id}[i] == \text{component id of element } i$.

Disjoint Set – fast find/connected

```
public class FastFindDS implements DisjointSet {
    private int[] id; // component ids
    private int count; // number of components
```

```
/**  
 * combine components containing p and q  
 */  
public void union(int p, int q) {  
    int pid = find(p);  
    int qid = find(q);  
    if (pid == qid) return;
```

Could be shortened with `connected(p, q)`. Expressed this way for consistency among different implementations.

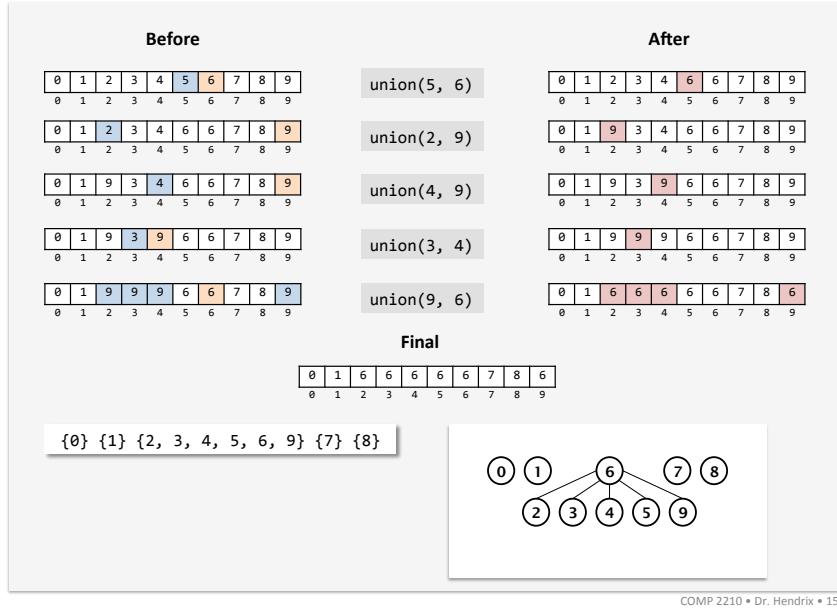

```
for (int i = 0; i < id.length; i++) {  
    if (id[i] == pid) id[i] = qid;  
    count--;
```

```
}
```

Disjoint Set – fast find/connected

Disjoint Set – fast find/connected

Fast find strategy: Let each component be identified by the label of one vertex in that component. Store these “component ids” in an int array such that $\text{id}[i] == \text{component id of element } i$.

Advantage: find, connected, and count are fast (and trivial to write)

Disadvantage: union will access every array element each time it's called.

Cost of find

$O(1)$ per find

$O(N)$ for a sequence of N finds

Cost of union

$O(N)$ per union

$O(N^2)$ for a sequence of N unions

COMP 2210 • Dr. Hendrix • 16

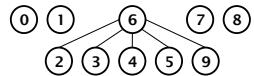

Disjoint Set – fast union

Fast union strategy: Let each component be identified by the label of one vertex in that component, its “root”. Store these “component ids” in an int array such that $\text{id}[i] == i$ is the “parent” of element i . The i for which $\text{id}[i] == i$ is the component root.

Disjoint Set – fast union

```
public class FastUnionDS implements DisjointSet {
    private int[] id; // component ids
    private int count; // number of components

    /**
     * return component for p
     */
    public int find(int p) {
        while (p != id[p])
            p = id[p];
        return p;
    }
}
```

`id[] [1 1 1 8 3 0 5 1 8 8]
0 1 2 3 4 5 6 7 8 9`

`find(8) == 8 find(9) == 8 find(4) == 8 find(6) == 1`

COMP 2210 • Dr. Hendrix • 21

Disjoint Set – fast union

```
public class FastUnionDS implements DisjointSet {
    private int[] id; // component ids
    private int count; // number of components
```

```
/**
 * combine components containing p and q
 */
public void union(int p, int q) {
    int pr = find(p);
    int qr = find(q);
    if (pr == qr)
        return;
}
```

`id[pr] = qr;` `count--;`

Exactly the same as in the fast find version,
except that `find()` returns the component
root.

Updates only one id per call. The
root of p is set to the root of q

`FastUnionDS ds = new FastUnionDS(6);`

COMP 2210 • Dr. Hendrix • 23

Disjoint Set – fast union

`public class FastUnionDS implements DisjointSet {`

`private int[] id; // component ids
private int count; // number of components`

`/**
 * return component for p
 */
public int find(int p) {`

`while (p != id[p])
 p = id[p];
 return p;
}`

`}`

`/**
 * are p and q in the same component?
 */
public boolean connected(int p, int q) {`

`return find(p) == find(q);
}`

`}`

`/**
 * return number of connected components
 */
public int count() {`

`return count;
}`

Must traverse parents
until the root is found

No change – exactly
the same as before

COMP 2210 • Dr. Hendrix • 24

Disjoint Set – fast union

Fast union strategy: Let each component be identified by the label of one vertex in that component, its “root”. Store these “component ids” in an int array such that $id[i] == i$ the “parent” of element i . The i for which $id[i] == i$ is the component root.

Advantage: Union updates less on average

Disadvantage: Find and connected no longer constant; union has linear worst case

Cost of find

$O(N)$ per find

$O(N^2)$ for a sequence of N finds

Cost of union

$O(N)$ per union

$O(N^2)$ for a sequence of N unions

COMP 2210 • Dr. Hendrix • 25

COMP 2210 • Dr. Hendrix • 27

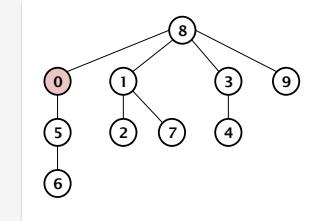

Disjoint Set – fast union with path compression

Each time we find the root of an element, replace the parent value of each examined element with the root value.

find(0) == 8

| | | | | | | | | | |
|---------------------------------------|--|--|--|--|--|--|--|--|--|
| 1 8 1 8 3 0 5 1 8 8 | | | | | | | | | |
| 0 1 2 3 4 5 6 7 8 9 | | | | | | | | | |
| | | | | | | | | | |

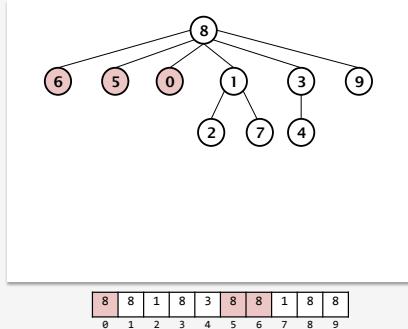

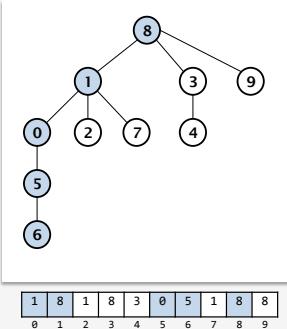

| | | | | | | | | | |
|---------------------------------------|--|--|--|--|--|--|--|--|--|
| 8 8 1 8 3 0 5 1 8 8 | | | | | | | | | |
| 0 1 2 3 4 5 6 7 8 9 | | | | | | | | | |
| | | | | | | | | | |

COMP 2210 • Dr. Hendrix • 28

Disjoint Set – fast union with path compression

Each time we find the root of an element, replace the parent value of each examined element with the root value.

`find(6) == 8`

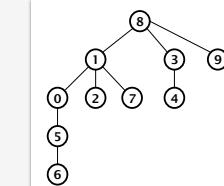

COMP 2210 • Dr. Hendrix • 29

Disjoint Set – fast union with path compression

```
public class FastUnionDS implements DisjointSet {
    public int find(int p) {
        int root = p;
        while (root != id[root])
            root = id[root];
        return root;
    }
}
```

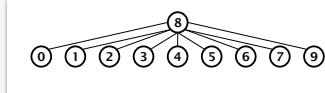

Without path compression:

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| 1 | 8 | 1 | 8 | 3 | 0 | 5 | 1 | 8 | 8 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |

With path compression:

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| 8 | 8 | 8 | 8 | 8 | 8 | 8 | 8 | 8 | 8 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |

COMP 2210 • Dr. Hendrix • 30

Disjoint Set – fast union

Second implementation strategy: Let each component be identified by the label of one vertex in that component, its “root”. Store these “component ids” in an int array such that `id[i] == i` is the “parent” of element i. The i for which `id[i] == i` is the component root.

Each time we find the root of an element, replace the parent value of each examined element with the root value.

Cost of find

$O(\log N)$ per find

$O(N \log N)$ for a sequence of N finds

Cost of union

$O(\log N)$ per union

$O(N \log N)$ for a sequence of N unions

COMP 2210 • Dr. Hendrix • 31

Applications

Kruskall's algorithm

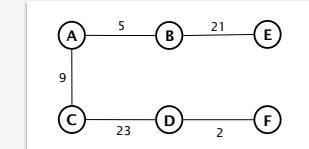

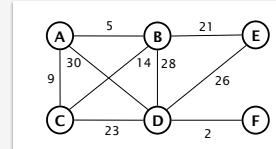

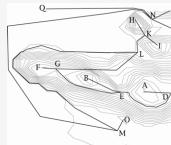

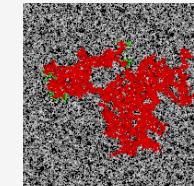

Image processing

Percolation system modeling

water, oil, etc. through ground
disease through populations

COMP 2210 • Dr. Hendrix • 32
